

Review Questions I — KEY

Spring 2010

The following review questions are similar to the kinds of questions you will be expected to answer on Exam I (tentatively scheduled for Mar. 4), which will cover LCR, chs. 1–6, and TCS, chs. 1–7. We have not yet covered the topics in LCR ch. 6 or TCS chs. 6–7, but go ahead and try to answer the questions, even if you have to guess, since it will help you to learn the material when we get to it.

Make sure you do your best to answer each question before you look at this Key; that will help you to learn. If you have any questions about the answers, please ask them in class or ask your Teaching Assistants. The actual exam will be about 16 questions.

1. (4 points)

Please answer the following questions.

- a. What `#include` statement do you always put at the top of your programs?
`#include <iostream>`
- b. What `using` statement do you always put at the top of your programs?
`using namespace std;`
- c. Declare an integer variable `N` and initialize it to 10.
`int N = 10;`
- d. Give a statement to increase the value of variable `N` by 10.
`N = N + 10;`
- e. What library would you include if you wanted to use the `sin`, `cos`, and `tan` functions?
`<cmath>`
- f. What library would you include if you wanted to do file input/output?
`<fstream>`
- g. What library would you include if you wanted to use vectors?
`<vector>`
- h. What library would you include if you wanted to use pseudo-random numbers?
`<cstdlib>`

2. (5 points)

Complete the code segment below to print “There are XXX days.” if integer `x` has a value 1 through 7 inclusive. Replace XXX with the value of variable `x`; note the period.

```

int x;
cin >> x;
// add your code here
if ((1 <= x) && (x <= 7)) {
    cout << "There are " << x << " days.\n";
}

```

3. (6 points)

What is the final value of each expression? Watch for integer division.

a. $12 + 6.8 / 2$
15.4

b. $15 / 6.0 + 2$
4.5

c. $(\text{int})30.55 / 4;$ // casting has precedence over division
7

4. (4 points)

You have an integer variable x that holds a four-digit positive integer. Write C++ code to store the middle two digits in integer variable y .

$y = x / 10 \% 100;$ **-OR-** $y = x \% 1000 / 10;$

5. (8 points)

Rewrite the following as a functionally equivalent while loop.

```

// M is an integer variable
for (i = 0; i < M; i++) {
    cout << i << " " << i*i << endl;
}

```

Answer:

```

i = 0;
while (i < M) {
    cout << i << " " << i*i << endl;
    i++;
}

```

6. (10 points)

What is the output from each code segment below?

```
a. int x = 1, y = 0;
   if (x > 0 && y < 0) {
       x = y = 23;
   }
   cout << x << " " << y << endl;
1  0
```

```
b. int x = 1, y = 0;
   if (x > 0 || y < 0) {
       x = y = 23;
   }
   cout << x << " " << y << endl;
23 23
```

```
c. x = 10; y = 40;
   if (x >= 10) {
       if (y < 40) {
           y++;
       } else {
           y--;
       }
   }
   cout << x << " " << y << endl;
10 39
```

```
d. x = 10; y = 40;
   if (x >= 10) {
       if (y < 40) {
           y++;
       }
   } else {
       y--;
   }
   cout << x << " " << y << endl;
10 40
```

e. In part d above, under what condition(s) would y be incremented?

Ans: If x is greater than or equal to 10 and y is less than 40.

7. (6 points)

How many times does each loop execute?

```
a. for (i = 0; i <= 100; i++) {  
    robot.translate(1);  
}
```

101 times

```
b. for (i = 1; i < 100; i++) {  
    robot.translate(1);  
}
```

99 times

8. (6 points)

Examine the code below. What (not how) does the following function do?

```
int mystery(int x, int y, int z)  
{  
    int temp;    // ultimately, holds returned value  
  
    temp = x;    // assume the largest is x  
    if(y > temp) { temp = y; }  
    if(z > temp) { temp = z; }  
    return temp;  
}
```

It returns the maximum of x, y, and z.

9. (8 points)

The Fibonacci numbers are defined:

```
fibonacci(0) = 1  
fibonacci(1) = 1  
fibonacci(n) = fibonacci(n-1) + fibonacci(n-2);
```

Write a recursive C++ function to compute the Fibonacci numbers:

```
int fibonacci (int n) {  
    // fill in  
    if ((n == 0) || (n == 1)) {  
        return 1;  
    } else {  
        return fibonacci(n-1) + fibonacci(n-2);  
    }  
}
```

10. (4 points)

What is printed in each case:

a) `cout << 3 * 4+5 << endl;`
17

b) `cout << 3.14159 + 10 / 4 << endl;`
5.14159

c) `cout << "3.14159" + "10 / 4" << endl;`
3.1415910 / 4

d) `int N = 17;`
`cout << (N = 16) << endl;`
16

11. (6 points)

Suppose that every time `currentTime()` is called, it returns the current time in the form of an integer (typically the number of seconds since a certain day in 1970). Using `currentTime()` and `motors()`, write C++ code to make the robot move forward at half speed for 45 seconds.

```
int start = currentTime();
while ((currentTime() - start < 45) {
    robot.motors(0.5,0.5);
}
```

12. (9 points)

Study the following code segment.

```
int N = 7;
int i, x;

for (i = 1; i <= N; i++) {
    cin >> x;
    cout << i << ". " << x << "    ";
    if(i % 3 == 0) { cout << endl; }
}
cout << endl;
```

a. What is displayed with the given input? Watch the `endl` characters.

Input: 11 12 13 14 15 16 17 18 19

1. 11 2. 12 3. 13
4. 14 5. 15 6. 16
7. 17

b. In terms of N , what is the value of the loop control variable upon termination?

$N+1$

13. (4 points)

1. Rewrite the following C++ statement to make it more robust (less prone to error).

```
if (x / y != 0 && y != 0) { cout << x / y << endl; }
```

Answer:

```
if (y != 0 && x / y != 0) { cout << x / y << endl; }
```

2. Rewrite the following C++ code segment to make it more efficient and to remove any unnecessary code.

```
if (x < y && y > x) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

Answer:

```
if (x < y) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

3. Rewrite the following C++ code segment to make it more efficient and to remove any unnecessary code.

```
if (x < y && y >= x) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

Answer:

```
if (x < y) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

4. Rewrite the following C++ code segment to make it more efficient and to remove any unnecessary code.

```
if (x < y || y >= x) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

Answer:

```
if (y >= x) { cout << "Not good.\n"; }  
cout << "Carry on.\n";
```

14. (4 points)

If A and B are boolean variables, then the expression `(!A) || (!B)` is equivalent to which of the following conditions:

- a) `(! (A && B))`
- b) `(! (A || B))`
- c) `(!A) && (!B)`
- d) `true`

Ans: (a)

15. (5 points)

Complete the function `sorted()` that returns `true` if two double vectors are sorted in ascending order, and `false` otherwise. Declare any variables that you need. To get full credit, your function must have a single exit point.

```
bool sorted (vector<int> A, vector<int> B) {
    bool ordered = true;    // assume vectors are sorted

    for (int i = 0; i < A.size()-1 && ordered; i++)
        if (A[i] > A[i + 1]) ordered = false;
    for (int i = 0; i < B.size()-1 && ordered; i++)
        if (B[i] > B[i + 1]) ordered = false;
    return ordered;
}
```

16. (5 points)

Write a C++ `main()` function that reads double numbers from a file called “`in.dat`” until it reaches the end-of-file, and prints the numbers on `cout`. Your program should not use vectors or arrays (which it does not need). Make sure to show any required `#includes`.

```
#include <iostream>
#include <fstream>
int main () {
    ifstream infile ("in.dat");
    while (!infile.eof()) {
        double datum;
        infile >> datum;
        cout << datum;
    }
    infile.close();    // not required, but good form
    return 0;
}
```

17. (5 points)

Describe in words and show in a diagram (you must do both to get full credit) how you would wire up a Braitenberg vehicle so that it exhibits the following behavior:

The vehicle accelerates towards light directly in front of it, but tends to veer away from light that is on one side or the other of it.

The left sensor is connected to the left motor and the right sensor to the right motor. See diagram for “Coward” in *LCR*, p. 145.

18. (5 points)

Write an `int` function `firstNB (string S)` that returns the index of the first nonblank character in `S`. If `S` does not have any nonblank characters, then your function should return the length of `S`.

```
int firstNB (string S) {  
    for (int loc = 0; loc < S.size(); loc++)  
        if (S[loc] != ' ') return loc;  
    return loc;  
}
```

There are many other ways to do this with either `for`-loops or `while`-loops.

19. (6 points)

Explain the difference between an *interoceptors* and an *exteroceptors*? Give an example of each.

Ans: Interoceptors are sensors used for sensing the internal state of the robot; exteroceptors are external sensors for sensing the environment of the robot. Examples of interoceptors include `getStall()` and `getBattery()`. Examples of exteroceptors include IR proximity detectors, light detectors, and video cameras.
